XIII Nefrološka škola: „NEFROLOGIJA 2018“

Tešanj, 06.10.2018.

Tematski dijelovi...

- Uvod
- Epidemiologija
- Riziko faktori
- Prognoza
- Screening

UVOD

- Uremični pacijent imaju veći rizik od razvoja maligniteta i to najčešće bubrega i urinarnog trakta.
- Tumori genito-urinarnog sistema su 4-5 puta češći nego tumori koji se razvijaju na drugim mjestima (pluća, kolon, rektum i dojke).

EPIDEMIOLOGIJA

- Posebna studija unutar ERA-EDTA Registra i ukljucila je 17.907 pacijenata iz Austrije, Spanije, Italije i UK u periodu od 1994 do 2001.

Co-morbidity in European RRT populations and access to renal transplantation

2805

Table 1. Baseline characteristics of RRT patients by national or regional registry

	All countries	Austria	Catalonia, Spain	Lombardy, Italy	Norway	UK, England/Wales
Number of patients	17907	3859	5932	4292	1204	2620
Incidence of RRT in 2000 (pmp) [§]	–	128.6	145.1	126 [#]	89.1	89

n=number of observed cancers.

Table 5: **Kidney cancer risk in ESRD patients**

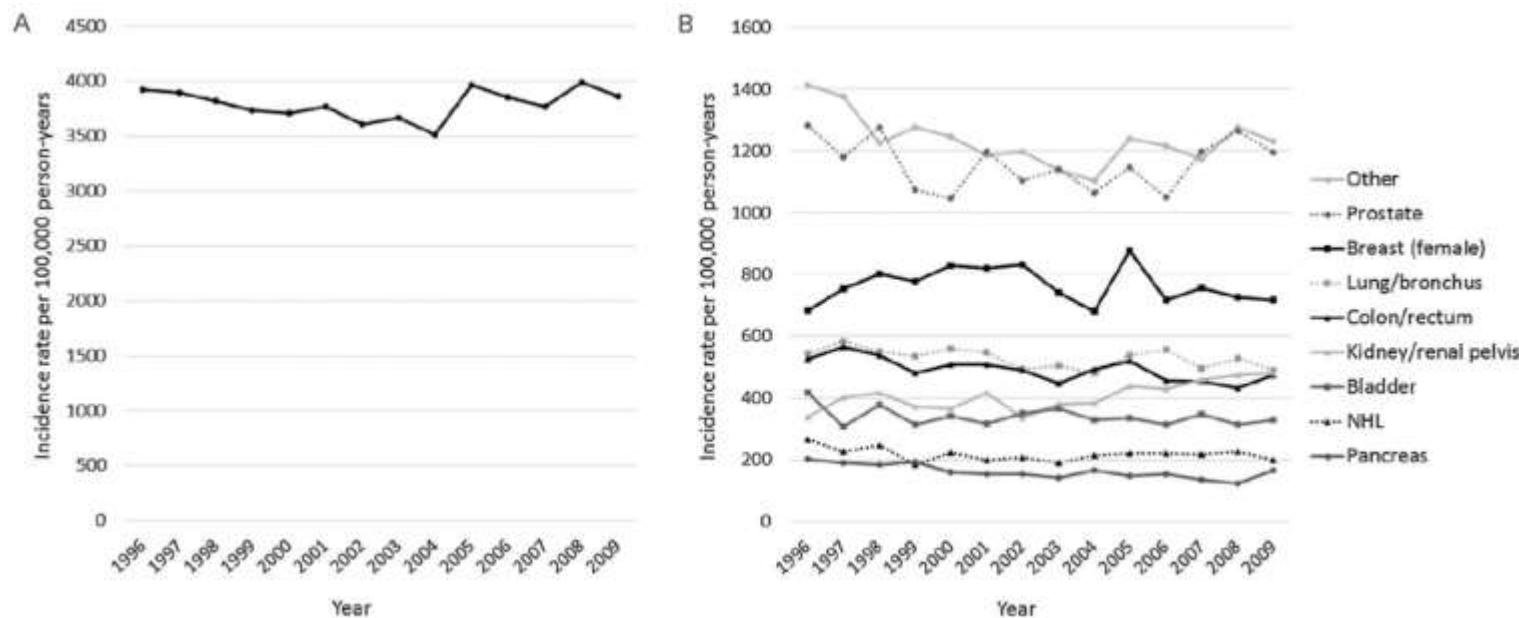

- Najčešće su oboljevali pacijenti ispod 35 godina, a incidenca se smanjivala sa povećanjem godina.
- Tipovi karcinoma koji su bili češći nego kod kontrolnih grupa su:
 - Karcinom bešike (SIR 1,5)
 - Karcinom bubrega (SIR 3,6)
 - Jetre, štitnjače, jezika, cerviksa, Non-Hodgkin limfoma.

	Australia and New Zealand		Europe	
	n	SIR (95% CI)	n	SIR (95% CI)

Cause uncertain or missing	1	0.8 (0.1-5.6)	173	1.3 (1.1-1.5)

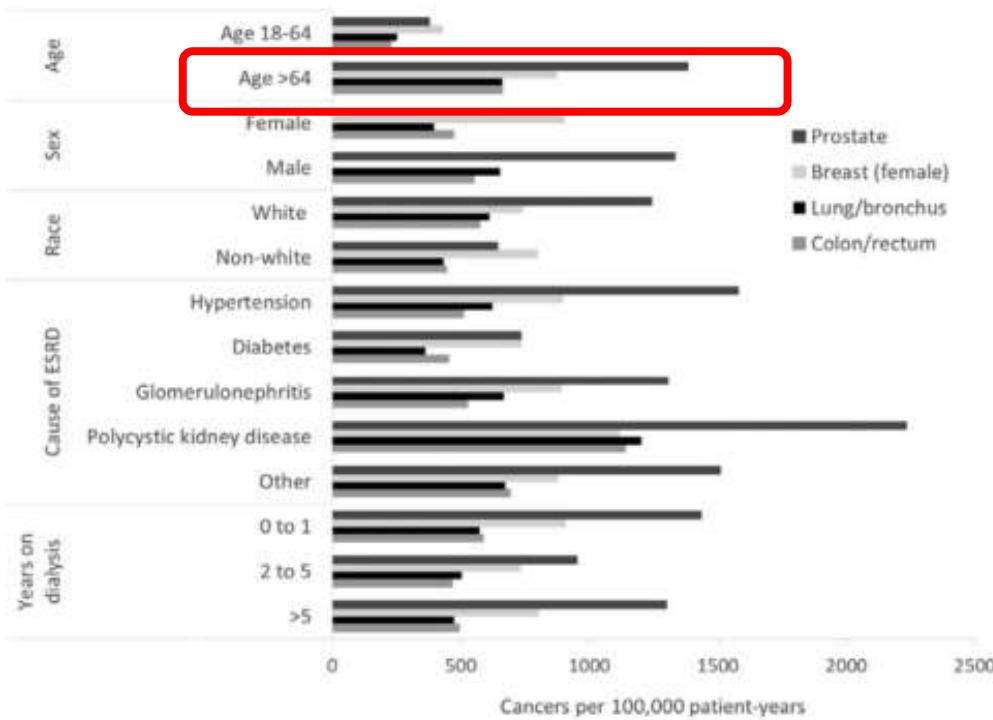

n=number of observed cancers.

Table 4: Bladder cancer risk in ESRD patients

- Nešto novija studija „US Medicare“ HD pacijenata između 1996 i 2009 pronašla je SIR od 1.42.
- Najveći rizik bio je od **karcinoma bubrega (SIR 4.03)** i **bešike (SIR 1.57)**.

- Nasuprot prosloj studiji, ovdje je nađen veći rizik za razvijanje karcinoma kod osoba **starijih od 65 godina** u vrijeme počinjanja HD.

- Studija kod Tajvanskih pacijenata na dijalizi pronašla je povećan rizik od razvoja karcinoma bešike i jetre.
- Međutim kod ovih pacijenata najveći rizik bio je kod mlađih pacijenata, te u prvoj godini od započinjanja dijalize.

*P<0.05.

**P < 0.001.

RIZIKO FAKTORI

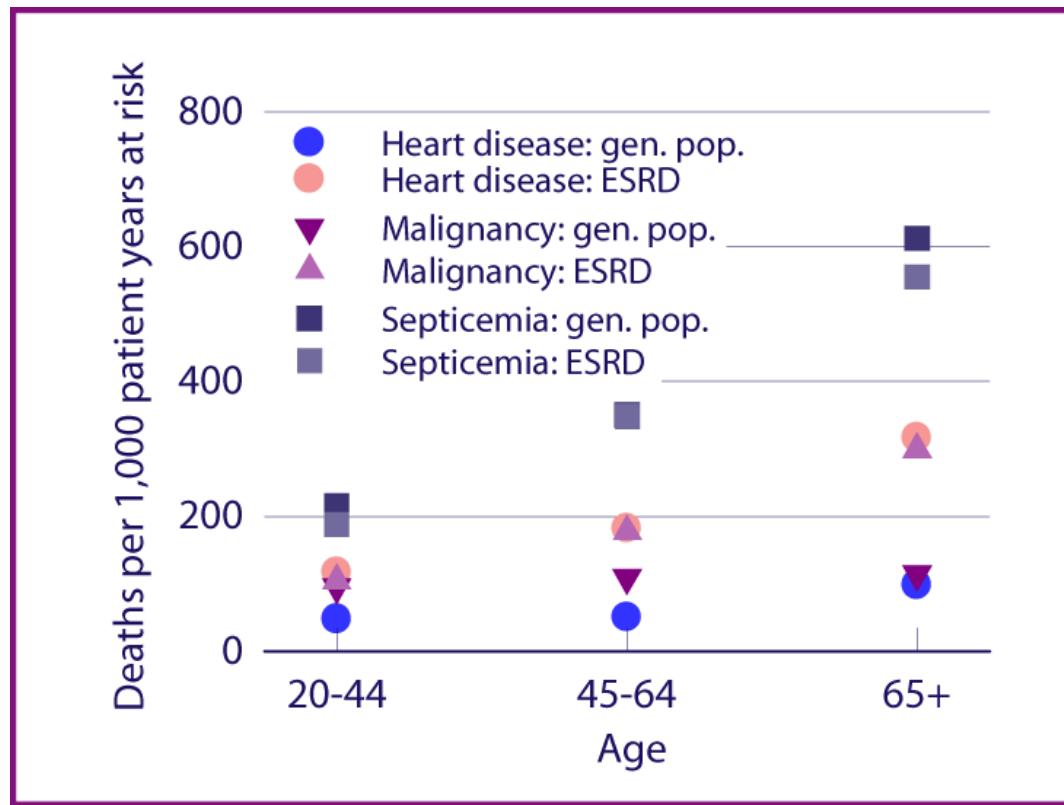

Faktori koji mogu doprinijeti povećanoj prevalenci maligniteta kod ljudi sa bubrežnim oboljenjem:

- Stečena policistična bolest bubrega – **karcinom bubrega**
- Infekcija hepatitisom B ili C – **karcinom jetre**
- Infekcija sa HPV – **karcinom cerviksa**
- Producena upotreba oralnog ciklofosfamida – **karcinom bešike**
- Produceno korištenje analgetika – **tranzicioni karcinom bešike i uretera**
- Pogoršana funkcija imunog sistema
- Nedostatak selena i drugih supstanci

PROGNOZA

- U United States Renal Data Survey (USRDS) 2007 pronađeno je da su karcinomi bili odgovorni za otprilike sedam smrtnih slučajeva na 1000 prevalent pacijenata - godine od 2003 – 2005.
- To je dosta niže u odnosu npr. na srčani zastoj (38 slučajeva na 1000 prevalent pacijenata).

ESRD & general Medicare patients with diagnosis in 2005; adjusted for gender & race. Medicare patients, 2005, used as reference cohort.

All-cause mortality: patients with major diseases, 2005

- Incidenca smrti od karcinoma je veća sa povećanjem trajanja dijalize (9 naspram 6,5 smrtnih slučajeva kod pacijenata koji su na dijalizi tri ili jednu godinu).
- Malignitet je češći kod HD pacijenata nasuprot CAPD pacijentima, te češći kod starijih pacijenata iznad 65 godina (osim u Tajvanskim studijama).

SCREENING

Incidenca tumora kod pacijenata sa ESRD

Cancer	SIR	Risk factors in ESRD	References
Renal cell	3.6–24.1	Acquired cystic disease	2–8
Bladder and ureter	1.5–16.4	Analgesic abuse, Balkan nephropathy, oral cyclophosphamide	2,3,5,6,8
Tongue	1.2–1.9	Human papilloma virus	2,3,6
Cervical and uterine	0.9	Human papilloma virus	6
2.7–4.3+			2,3
Liver	1.4–4.5	Hepatitis B and C	2,3,5,6
Thyroid and other	2.2–2.3		2,3,6
Endocrine organs			
Breast (women)	0.8–1.42		3,6,8
Lung/bronchus	0.5–1.28		3,6,8
Colon/rectum	1.0–1.27		3,6,8
Pancreas	1.08		8
Prostate	0.5–1.08		3,6,8

- Hipotetski model studije screeninga maligniteta iz 1996 predlozio je da bi u prosjeku screening maligniteta kod ESRD pacijenata donio neto benefit u prezivljavanju od 5 (pet) dana u poređenju sa opcom populacijom.
- Screening se bazirao na mammografiji, Papanicolaou testu, flexibilnoj sigmoidoskopiji, serum PSA antigenu.
- Zaključak studije je da rutinski screening maligniteta kod ESRD pacijenata ne predstavlja adekvatno trošenje sredstava.
- Druga studija iz 2008, fokusirala se na screening tumora dojke kod dijaliznih pacijenata, nasla je absolutnu redukciju mortaliteta tumora dojke od 0.1%, sa neto dobiti u prezivljavanju od 1,3 dana.

Table 3. Suggested cancer screening in ESRD patients:
Individualized, considering expected survival, risk factors,
and transplant status

Cancer	Recommended screening
Breast	-Yearly mammogram beginning age 40 and on transplant list Clinical breast examination every 3 years for ages 20–39 and yearly for age >40
Colorectal	Beginning age 50: Yearly FIT or FOBT for those on transplant lists and flexible sigmoidoscopy, colonoscopy, double contrast barium enema, or virtual colonoscopy per transplant evaluation protocols Positive FIT or FOBT will require additional evaluation
Cervical	Begin screening at age 21: 21–65, yearly Pap for those on transplant list; consider HPV DNA and HPV vaccine in transplant candidates
Prostate	Age 50, annual PSA and digital rectal examination for men on transplant list Age 45 if African American or father or brother had prostate cancer before the age of 65
Renal cell	Yearly CT or MRI in patients on dialysis >3 years and on transplant list

For all the above cancers, consider screening in high-risk patients with long expected survival. FIT, fecal immunochemical test; FOBT, fecal occult blood test. Adapted from references 22–29.

- Na Klinici za hemodijalizu je 2008 godine rađena studija, u kojoj smo evaluirali ishode za 31 pacijenta sa karcinomom od ukupno 200 pacijenata u periodu 2002-2007.
- Od 31 pacijenta ukupno je umrlo 15 u follow-up periodu.
- Tri pacijenta od 15 imalo je karcionom prostate, a četiri su imali papilarni karcinom.

NI-Nephritis interstitialis

- Ponovljena studijska analiza podataka na Klinici za Hemodijalizu KCUS za period 2008 – 2018 evaluirala je 28 pacijenta sa karcinomom od ukupno 300 pacijenata.
- Od 28 pacijenata ukupno je umrlo 13 u follow-up periodu.
- Ukupno je bilo 7 žena i 21 muškarac.
- Srednja životna dob testiranih pacijenata je bila 68.7 ± 11.00 (SE \bar{x} : 2.12) godina.
- Najviše karcinoma je pripadalo digestivnom traktu, plućima, urinarnom traktu i koži.

Take home messages

- Iako tumor mokracne besike i virusno-posredovani tumori (tumor grlica materice posredovan HPV virusom ili tumor jetre posredovan hepatiti B i C virusima), su cesci kod pacijenata sa ESRD, nije preporučljiva opsta rutina screeninga kod ovakvih pacijenata.
- ESRD pacijenti kod kojih je preporučljiv screening su:
 - Pacijenti sa dobrom izgledima za prezivljavanje
 - Kandidati za transplantaciju bubrega
 - Pacijenti sa većim rizikom za razvoj tumora, ali dobrom izgledima za prezivljavanje.
- Nije preporučljiv screening za pacijente sa policisticnom bolesti bubrega iako postoji povecan rizik od razvoja Ca bubrega.
- Uкупne raspoložive informacije pokazuju da rutinski screening kod ESRD pacijenata ipak nije preporučljiv, ali da se protokol screeninga može obavljati kod individualiziranih pacijenata na osnovu personalnih riziko faktora.

HVALA NA PAŽNJI
